Instructions on how to use the QR codes throughout the booklet:

QR codes at the top left/right of the page opens the webpage associated with the page title. QR codes next to information, or the hyperlinked text, open the webpage related to that information.

To use a QR code, open your mobile device's camera app, **cover any codes around the one you need to scan**, carefully hover your mobile device over the QR code until you see a link appear. Lightly touch the link that appears on screen. It will open a webpage on our site.

Scan the QR code below and click the link to view updates of the grant award summaries and download a PDF of this booklet.

Some of Southern SARE Recent Outreach Highlights

We increased efforts to demographics we had not been reaching successfully before, including an increase in BIPOC grant applications and awards.

The number of women applying and receiving funding is growing.

Substantial attention was given by American farmers to sustainability metrics on large-scale farms.

Expansion of the Model State Program funding resulted in more institutions working together to increase SSARE's impact state and region wide.

Access to grant and non-grant funding as well as SARE educational resources increased to farmers and NGOs in locations with limited awareness prior to 2022.

About Southern SARE & This Publication

Southern SARE's Vision

is an enduring American agriculture of the highest quality.
This agriculture is profitable, protects the nation's land and water,
and is a force for a rewarding way of life for farmers and ranchers
whose quality products and operations sustain their communities and society.

Southern Sustainable Agriculture Research and Education (SSARE) is one of four regional SARE programs funded by the USDA National Institute of Food and Agriculture. SSARE serves all states and island protectorates from **Oklahoma, Texas, Arkansas, Louisiana, Kentucky, Tennessee, Mississippi, Alabama, Virginia, North and South Carolina** over to **Georgia, Florida**, up along to through then down the Atlantic to **Puerto Rico** and the **Virgin Islands** in the Caribbean Sea. Southern SARE is administered by our host institution the University of Georgia, an 1862 land grant; Fort Valley State University, an 1890 land grant and the Kerr Center for Sustainable Agriculture, a non-profit in Oklahoma. One outreach staff member also works through research faculty employment at University of Kentucky, an 1862 land grant institution.

SARE's nationwide mission is to advance, to the whole of American agriculture, innovations that improve profitability, stewardship, and quality of life by investing in groundbreaking research and education. SSARE has been **fostering sustainable agriculture production and marketing efforts for over three decades**, primarily through grant programs for farmers/ranchers, researchers, NGOs, government agencies and graduate students to address key issues affecting the sustainability of agriculture throughout our region.

SSARE funds several different **competitive grant programs**; each type of grant benefits a specific target audience. Each year, SSARE invites applicants to submit proposals for various grant opportunities. SARE grants are open to **farmers/ranchers, researchers, educators, graduate students, government agencies, community groups, non-profit organizations, non-governmental organization (NGO), and agribusinesses**. Other funding is also available to individuals and groups through non-grant programs like travel scholarships and conference/event sponsorships.

To date, SSARE has funded approximately **9,447 grants**, totalling over **\$450 million**. In 2022-24, **nearly \$89 million** and **1,270 grants** were awarded across the six grant programs in the Southern region for **Research & Education, Professional Development Program, Graduate Student, On-Farm Research, Producer and Education grants**. Other funding opportunities available are [conference/event sponsorships](#), [travel scholarships](#) and the [sustainable agriculture leadership program](#). [Search all projects](#) by commodities or practices as indicated by the project coordinator.

About this Publication

This publication provides a **list of recent and presently funded SSARE projects** throughout the Southern region including **summaries of competitive grant and non-grant programs**. The report also **highlights the impacts of funded programs and educational resources**. Some competitive grant programs that are no longer offered may be excluded from the totals in this report.

To find a complete list of projects funded in each state, visit the [Southern SARE website](https://southern.sare.org) and search the Projects Database.

SSARE Grants & Other Funding in 2022-24

Competitive research grants are the primary tools of the SARE program. The overall objective of SARE is to position agricultural communities so the most sustainable approaches available permeate U.S. agriculture. The result is food, fiber and animal products are sustainably produced in healthy communities in an environment where farmers are respected, rewarded and encouraged to innovate.

38 Research and Education Grants (R&E - \$13,738,417) ssare.org/research

Research and Education Grants encourage a systems approach to sustainable agriculture. They are mainly designed for teams of interdisciplinary researchers.

25 Professional Development Program Grants (PDP - \$1,847,950) ssare.org/pdp

Professional Development Program Grants further education and outreach strategies for professionals and educators who work directly with farmers and ranchers.

32 On-Farm Research Grants (OFRG - \$819,350) ssare.org/onfarm

On-Farm Research Grants provide opportunities for agriculture professionals working directly with farmers and ranchers on sustainable agriculture efforts.

63 Graduate Student Grants (GRAD - \$1,068,506) ssare.org/graduate

Graduate Student Grants are for Masters and PhD students enrolled in a graduate program at an accredited institution who want to research sustainable agriculture.

39 Producer Grants (PROD - \$614,795) ssare.org/producer

Producer Grants enable farmers and ranchers to test a sustainable agriculture idea using a field trial, on-farm demonstration, marketing initiative, or other technique.

40 Education Grants (ED - \$1,765,798) ssare.org/education

Education Grants allow applicants to conduct education and outreach activities to benefit the greater sustainable agriculture community and promote efforts in farmer innovations, community resilience, business success, diversification, and best management practices.

Other Funding

Event/Conference Sponsorships ssare.org/sponsorships

Regional sponsorship support for conferences, field days, workshops and other educational events organized by universities, community organizations, NGOs, mentor farmers and other ag professionals. These must take place in the Southern region and the main purpose should further sustainable agriculture for the benefit of farmers, NGOs, community organizations, researchers and other ag professionals.

Travel Scholarships ssare.org/travel fund travel to conferences where information may be imparted or gained for sustainable agriculture. Individuals requesting travel scholarship funds for personal attendance to an event to gain knowledge/skill for use in training others.

Sustainable Agriculture Leadership Program ssare.org/agleadership

Operated by SSARE's Equity and Prosperity Committee, this funding champions the leadership contributions of these groups and individuals by providing a small amount of sponsorship funds to support sustainable agriculture education and training activities throughout the Southern region. The purpose of the program is to enhance the resiliency, strength and vivacity of farmer and ranchers, particularly historically underserved audiences.

History of Southern SARE Grants (1988-2024)

LOCATION	R&E	PDP	OFRG	GRADUATE	PRODUCER	EDUCATION	TOTAL

State/Territory Awards Summary for 2022-24

[Alabama](#) was awarded \$1,523,257 grants to support 15 projects, including but not limited to, 3 research and/or education, 2 professional development, 1 on-farm, 5 graduate student, 3 producer, and 1 education.

[Arkansas](#) was awarded \$1,052,978 grants to support 10 projects, including but not limited to, 2 research and/or education, 1 professional development, 1 on-farm, 1 graduate student, 1 producer, and 4 education.

[Florida](#) was awarded \$1,052,978 grants to support 35 projects, including but not limited to, 4 research and/or education, 1 professional development, 4 on-farm, 21 graduate student, 3 producer, and 2 education.

[Georgia](#) was awarded \$2,152,191 grants to support 32 projects, including but not limited to, 4 research and/or education, 2 professional development, 4 on-farm, 8 graduate, 7 producer and 6 education.

[Kentucky](#) was awarded \$503,640 grants to support 6 projects, including but not limited to, 1 research and/or education, 2 on-farm, 2 producer and 1 education.

[Louisiana](#) was awarded \$117,219 grants to support 3 projects, including but not limited to, 1 research and/or education, 1 on-farm, and 1 producer-led.

[Mississippi](#) was awarded \$1,413,393 grants to support 9 projects, including but not limited to, 3 research and/or education, 1 education, 2 professional development, 1 graduate student, and 2 on-farm.

[North Carolina](#) was awarded \$2,233,331 grants to support 26 projects, including but not limited to, 4 research and/or education, 6 professional development, 1 graduate student, 4 on-farm, 5 producer, and 6 education.

[Oklahoma](#) was awarded \$423,537 grants to support 2 projects, including but not limited to, 1 research and/or education and 1 producer.

[Puerto Rico](#) was awarded \$317,559 grants to support 9 projects, including but not limited to, 1 professional development, 2 graduate student, 1 producer, and 5 education.

[South Carolina](#) was awarded \$2,240,210 grants to support 16 projects, including but not limited to, 5 research and/or education, 2 professional development, 4 graduate student, 2 producer, and 3 education.

[Tennessee](#) was awarded \$317,559 grants to support 17 projects, including but not limited to, 3 research and/or education, 1 professional development, 1 on-farm, 6 graduate student, 1 producer and 5 education.

[Texas](#) was awarded \$3,003,670 grants to support 32 projects, including 6 research and/or education, 4 professional development, 6 on-farm, 9 graduate student, 4 producer and 3 education.

The [Virgin Islands of the United States](#) were awarded \$169,155 grants to support 5 projects, including 2 on-farm, 1 producer and 2 education.

[Virginia](#) was awarded \$317,559 grants to support 23 projects, including 1 research and/or education, 3 professional development, 4 on-farm, 5 graduate student, 7 producer and 1 education.

Each location also had non-competitive awards that fund the activities of the SARE state coordinator(s). For a complete list of awards by state, visit projects.sare.org/state-fact-sheets.

Project Impacts

These details from grantee reports shows how SARE's funding and resources support family farms, promote conservation, and strengthen communities through sustainable agriculture strategies. Learn about local impacts at southern.sare.org/sare-in-your-state.

237 PROJECTS COMPLETED

7,275 FARMERS/RANCHERS REACHED

2,908 received SARE and other SA* resources

10,004 participated in grants

443 participated in research

3,643 reported KASA* changes

607 changed a practice

2,130 AG SERVICE PROVIDERS

382 reported KASA changes

2,505 received SARE and other SA resources

68 used KASA in their activities

239 intend to use KASA

188 new working collaborations

OTHER PARTICIPANTS (PDP)

2,542 Others

490 Farmers

96 Extension

387 NRCS

219 Agencies

192 Non-profits

182 Researchers

EDUCATIONAL ACTIVITIES

1,008 Consultations

98 Online trainings

182 Travel scholarships

1,811 Curricula

325 Webinars / Talks / Presentations

203 Workshops/Field days

275 On-farm demonstrations

78 Published press articles, newsletters

151 Tours

85 Other

13 Journal articles

4 Study circles/Focus groups

KASA (Knowledge, Awareness, Skill or Attitude changes)

SA (Sustainable Agriculture)

Resources & Education

Most SARE Outreach publications including all learning products and those published by grantees are available online as free downloads. Many are also available in print and may be ordered online at sare.org/resources or by **telephone at (301) 779-1007**. Free materials (bulletins, topic briefs and promotional materials) are available in quantity at no cost to agricultural educators. Discounts are available for books ordered in quantity.

A list of SARE Outreach publications available in print is available at sare.org/available-in-print.

New Products All new products (including multimedia products and those not available in print) recently produced by SARE Outreach: sare.org/whats-new. New products released within the last 12 months include the book Farming with Soil Life, the bulletins Best Practices for the Sustainable Urban Farm, Resilient Farmers, Ranchers and Communities: Social Sustainability in Agriculture, Transitioning to Organic Production, and What is Sustainable Agriculture?, a series of project profiles on managing stress, and an episode of America's Heartland featuring farmer leaders in sustainability and SARE.

Browse our most popular products: sare.org/sare-outreach-publications

SSARE Publications Kit

Order an entire set of SARE Outreach books and bulletins here on this webpage for one low price! The set includes all books, bulletins, biennial reports, topic briefs and promotional materials. Visit sare.org/sare-publications-kit to see what is currently in the set.

SSARE Library USB Drive

Order SSARE's Library of Publications thumb drives for access to SSARE's current publications, program materials, videos and selected regional materials right at your fingertips—no internet connection needed. Each thumb drive includes Books, Bulletins, Fact Sheets, Regional Materials, Reports from the Field, SSARE Program Materials, Videos from the Field and Youth Education Resources. These lightweight drives are made from 70% post-consumer waste. This item includes 1 USB drive. Resources published after 8/1/2023 are not currently included in this product. Check the table of contents for a complete list of publications included.

Individual USB drives do not qualify for our standard quantity discounts, but they can also be purchased in lots of 10 at a discount at sare.org/usb.

What is Sustainable Agriculture?

To read, watch the video, or download a free pdf or order print copies at this page: sare.org/what-is-sustainable-agriculture

¿Qué es la Agricultura Sostenible?

sare.org/que-es-la-agricultura-sostenible

¿Qué es la Agricultura Sustentable? (con Video)

Qué puede haber para que su finca o rancho sea más sustentable? No hay una respuesta simple, pero la serie de animación de 8 episodios de SARE “Qué es la agricultura sostenible” destaca algunas prácticas comunes usadas por productores en todo el país para mejorar la rentabilidad, calidad de vida y el manejo ambiental.

Cultivos de Cobertura para Rotaciones de Cultivos Sustentables

An abbreviated, Spanish language translation of SARE's Cover Crops for Sustainable Crop Rotations topic brief. It is also available in English and Chinese. sare.org/resources/cultivos-de-cobertura-para-rotaciones-de-cultivos-sustentables

Resources & Education

Growing New Markets for Specialty Crops Podcast Episodes

This series of episodes of Voices from the Field is part of a series co-produced by ATTRA and SARE that explores the different ways farmers are working to create new local markets for specialty and niche crops. Each partner episode will address a different production system or crop—from endives to small-grain value chains—and will feature farmers sharing their production and marketing strategies, challenges and successes along the way. sare.org/growing-new-markets-for-specialty-crops

Best Practices for the Sustainable Urban Farm

sare.org/urban-agriculture

Transitioning to Organic Production

Farmers and ranchers decide to pursue organic certification for many personal, financial and environmental reasons. This publication introduces you to requirements of the USDA National Organic Program. It outlines many of the key strategies producers use to make their three-year transition to organic production a successful one. It discusses the practice areas common to all organic systems. sare.org/transitioning-to-organic

Resilient Farmers, Ranchers and Communities: Social Sustainability in Agriculture

The purpose of this bulletin is to draw special attention to social sustainability in ag. It describes how we can think of social sustainability, outlines some of the most pressing personal and social challenges facing all of us who are engaged in agriculture, and offers some suggestions for how we, like Badjie and Hoyte, can begin to make ourselves, our employees, our families and our communities more prosperous, resilient and sustainable. sare.org/social-sustainability or call (301) 779-1007.

Managing Stress

Farming and ranching are stressful businesses. One key metric of a farm's sustainability is its capacity to provide a quality of life that meets one of our most basic human needs - good mental health. Visit this page for resources and highlights of successful SARE-funded projects that are using innovative strategies to help farmers and ranchers manage stress. sare.org/managing-stress

Scaling Up Your Vegetable Farm for Wholesale Markets

For direct market farmers, expanding your operation to capture local and regional wholesale markets can represent an opportunity. But such a shift brings with it many changes to how you run your farm because the expectations that wholesale buyers have is much different than your direct market customers. Scaling Up Your Vegetable Farm for Wholesale Markets guides you through the likely changes you'll need to take into consideration when planning to branch out into wholesale markets. These include business planning, working with wholesale buyers, and areas of production that range from increasing yield and produce quality, to harvest and postharvest handling, food safety and more. sare.org/scaling-up-your-vegetable-farm-for-wholesale-markets

Pest Exclusion Systems for Pest Management in Vegetable Production Across the Southeast

This bulletin provides data and information from on-farm demonstrations on the use of pest exclusion systems. Pest exclusion systems use shade cloths as a barrier around high tunnels, low tunnels and hoop houses to exclude insect pests. ssare.org/pest-exclusion-systems

ALABAMA

Alabama Project Highlight: Alabama Farmer Helping to Diversify State's Aquaculture Production with Crawfish

David Coddington has successfully owned and operated Greene Prairie Aquafarms in Boligee, Alabama, for twenty-one years. Coddington has done so with the help of the Southern SARE Producer grant that he used to study what proper pond salinity acclimation for shrimp is best to protect them from insect predation. This research allowed Coddington's shrimp farm to thrive for years until a sharp decrease in demand for shrimp had significantly cut Coddington's profits. The statewide shift in the aquaculture industry motivated him to raise crawfish to see if they could potentially be a more profitable alternative to shrimp.

To answer this question, Coddington obtained another SARE grant

David Coddington and his son, Joel, pull a short-neck trap from a pond at Greene Prairie Aquafarm to check for crawfish preliminary data from a SSARE Producer Grant has shown that short-neck traps are easier to manage than long-neck traps.

to begin a new study, "Increasing Sustainability of Crawfish and Low Salinity Shrimp Production in West Alabama." This grant

helped Coddington analyze how pond depth, salinity and various feeding methods impact the yield of crawfish. In this project, Coddington worked alongside Auburn Alabama Fish Farming Center Extension specialist Luke Roy and farmer Jesse James. Together, they developed an enterprise budget between traditional and deep-water crawfish systems and determined the best feeding methods. In addition, they analyzed the use of short-neck and long-neck traps for harvesting efficacy and impacts on yield to create the best practices that create the most sustainable and profitable aquaculture farm possible.

For more information on this project, see sare.org/projects and search for project number [FS20-322](#).

Research and Education Grants

[LS24-398](#) Integrating tannin-rich legumes into tall fescue pasture to strengthen the sustainability of beef cattle production in the southern United States, \$398,589, Auburn University

[LS23-383](#) Grazing diversified cover crops as an alternative to improve land-use efficiency and sustainability in the Southeast, \$380,000, Auburn University, University of Florida

[LS23-385](#) Reducing the Environmental Impact of Beef Production Through the Use of Naturally Occurring Secondary Plant Metabolites in Southeastern Forage Systems, \$383,996, Auburn University, University of Georgia, Texas A&M AgriLife Research

Professional Development Program

[SPDP24-024](#) Little USA Community Solar Campus Agrivoltaics Training and Curriculum Development, \$79,965, Little USA Community Solar Campus

[GS23-293](#) Evaluating the Potential to Breed Kura Clover for a Southeastern U.S. Adapted Living Mulch System, \$16,363, Auburn University

[GS22-257](#) Farmer Profitability and Willingness to Accept Payment to Adopt Cover Crops in Alabama, \$16,500, Auburn University

[GS22-265](#) Supporting Peach Growers with a Phenological Approach for Best Management Practices, \$16,281, Auburn University

Producer Grants

[FS24-361](#) Hawthorn Heritage: Cultivating Native Varieties for Sustainable Forestry and Agriculture, \$16,305, Carmoni Partners

[FS24-362](#) Lettuce season extension for warmer climates, \$8,225, Snow's Bend Farm

[FS22-343](#) Project Urban Mushrooms on Mimosa Wood, \$14,951, Fountain Heights Farms

Education Only

[EDS22-42](#) Southern Farmer Leadership Fellowship for Farmer-led Racial Equity and Sustainability Projects in the South, \$49,767, National Young Farmers Coalition

ARKANSAS

Arkansas Project Highlight: Using Mineral Clay to Manage Pests and Increase Fruit Quality and Yield in Blackberries

Researchers at the University of Arkansas studied the impacts of kaolin clay on managing blackberry production. The University of Arkansas obtained a SARE grant to determine whether the use of mineral particle films such as kaolin clay helped protect plants from solar injury and enhanced primocane fruit production. For years, blackberries had been an important fruit crop for farmers across Arkansas. Recently, a new species of blackberries, primocane, changed the way farmers are growing berries. Primocane blackberries have shown to extend the fruiting season by months over traditional plant varieties, making them a much more profitable option for farmers. However, this species doesn't come without its pest and production challenges, which University of Arkansas researchers

A delayed dormant application of Sulforix was applied to both IPM treatments (IPM with and without Surround)

tried to solve with a naturally occurring soil mineral, kaolin clay. Kaolin clay is a naturally occurring mineral that is touted for its pest repellant features and its ability to reduce sunburn on crops, which made it a potentially viable option for protecting primocane blackberries.

University of Arkansas entomologist Donn Johnson said they collected field data and assessed the effectiveness of the kaolin clay whitewash on pest control. Experiment sites were established on two commercial farms in northern and central Arkansas, including Sta-N-Step Farm near Fayetteville and Gillam Farms near Judsonia. Various amounts of the kaolin clay whitewash were applied to the sites to evaluate its effects on blackberry production. These sites helped to determine whether this whitewash was an effective and sustainable solution for blackberry farmers looking to increase production.

FLORIDA

Florida Project Highlight: Using Flowering Plants on Strawberry Field Edges to Enhance Natural Enemies and Pollinators and Improve Pest Control and Fruit Quality

Researchers at the University of Florida investigated if using wildflower plantings along strawberry field edges would help with sustainable pest management. Over the last few years, Florida strawberry growers faced criticism due to suspected and documented cases of insecticide resistance. To help combat this, the University of Florida obtained a SARE grant to determine if using wildflower plantings can help to sustainably manage pests and reduce reliance on insecticides. Researchers found that these flowering plants could serve as a resource for conserving natural enemies and other beneficial insects while reducing pests.

To study this, University researchers planted two native flowering

plants, sweet alyssum and Spanish needles, on the edge of strawberry fields on an organic strawberry farm in Hillsborough

County, FL. Researchers monitored thrips and minute pirate bug populations in the rows closest to the flowering plants. These experiments measured the presence of natural enemies to determine if the plants could be used as an alternative method for pest management and provided greater levels of pollination than in strawberry fields without flowering plants. The project sought to address the issue of poor or lacking habitat for beneficial insects in agriculture while

meeting the goal of making the whole of strawberry production in Florida more productive, sustainable, and beneficial to the environment, public health and communities.

For more information on this project, see sare.org/projects and search for project number [OS16-098](#).

One row of alyssum replaced a row of strawberry in the raised bed and the row of Spanish needles was in the bed shoulder.

ON-FARM RESEARCH GRANTS provide opportunities for agriculture professionals working directly with farmers and ranchers on sustainable agriculture efforts.

GRANT SCHEDULE

September: On-Farm Research Grant Calls for Proposals are released.

December: On-Farm Research Grants are due.

March: On-Farm Research Grants are awarded.

Proposals open September and grants are awarded in February the following calendar year. Project maximums are \$30,000 for 2-year projects.

GEORGIA

Georgia Project Highlight: Effects of Imidacloprid Soil Drench Applications on Nesting Blue Orchard Mason Bees

Christine Fortuin, a postdoctoral researcher at the University of

Georgia, studied the impact that pesticides containing imidacloprid had on the health of Blue Orchard Mason bees. Blue Orchard Mason bees are one of the few bees native to North America that can be a managed pollinator for orchard crops like apples, cherries, and blueberries. Mason bees also have a much higher pollination rate than other pollinators, making them crucial to sustainable agriculture. Mason bees get their name because they do not build a wax-comb hive but instead use mud to build their nests within naturally existing holes. Fortuin and

other scientists hypothesized that the mud is a potential source of harmful exposure to pesticide residue.

Fig. 1:

- A) Flight cages enclosing rabbiteye blueberry shrubs
B) Nest block containing paper tubes
C) Marked female *O. lignaria* at nest tube entrance
D) Insect cages used for mortality assessment

To study this, Fortuin obtained a SARE grant to assess the impact of imidacloprid-treated soil on adult female Mason bees. The study created experimental zones in Athens, Georgia, where

groups of female bees were exposed to soil containing varying levels of imidacloprid residue. These zones were then monitored to determine if any differences could be detected in their nesting patterns, overall health, viability of offspring and soil preference. Fortuin's research showed that under the right conditions, adult bees can be seriously impacted by exposure to imidacloprid residue. This project showed that wild bees can be impacted by neonicotinoid pesticide residues and therefore that the soil pathway should be considered by regulatory bodies when setting the safety guidelines for pesticide use.

For more information on this project, see sare.org/projects and search for project number [GS18-182](#).

Southeast Outreach Coordinator
SSARE 1890 Land Grant Liaison

KENTUCKY

Kentucky Project Highlight: Adding Livestock Farm Diversification with Yaks

Since 2013, Greg Dike has raised yaks on his farm in Morehead, Kentucky. Dike has raised yaks as an alternative to beef cattle production due to the challenges associated with beef production. In recent years, yaks have increased in popularity due to their gentle demeanor, lean meat, high quality fiber and small environmental impact. Yaks have become so popular that Dike, who mainly raises yaks for breeding, couldn't keep up with the demand from farmers who wanted to start their own herds.

To solve this problem, Dike obtained a Southern SARE Producer grant to research the best methods for yak reproduction. Dike partnered with researchers at Morehead State University (Philip Prater and animal science professor Patricia Harrelson) and

Audacious-Born 3-9-23 F-scaled

University of Kentucky (beef cattle specialist Jeffery Lehmkuhler and Menifee County Extension agent Mary McCarty) to determine the best technology for breeding yaks. Dike and his research partners were also interested in developing a program that could be used for educating small-acreage farmers and beef producers on the potential benefits of introducing yaks and AI to their operations. Together, the researchers investigated the performance of yaks within forage-based systems with the goal of developing on-farm data collection for yaks, evaluating seasonal growth patterns of yaks raised in the Southeast, and assessing the potential for yak meat market development. This project opened up the opportunity for more producers to participate, thereby creating a more profitable and sustainable meat market.

For more information on this project, see sare.org/projects and search for project number [FS21-335](#).

“Native cover crops are easier to establish than their non-native counter parts and promote the presence of less pests and diseases and compete less with the main crop for soil resources like moisture,” said Johnson.”

Paul Vincelli
Scientist-at-Large
SSARE 1862 Land Grant Liaison

CONFERENCE & EVENT SPONSORSHIPS are for regional/national conferences, field days, workshops and other educational activities organized by universities, community organizations, NGOs, mentor farmers and other ag professionals. Located in the Southern region, the main purpose should further sustainable agriculture for the benefit of farmers, NGOs, community organizations, researchers and other ag professionals.

LOUISIANA

Louisiana Project Highlight: Cover Crops Incorporated into Rotational Grazing Improves Soil Health

Researchers at Louisiana State University (LSU) tried to improve soil quality by planting a diverse mix of winter cover crops. For years, farmers have utilized various fertilizers and grazing techniques to try and make their soil as healthy and productive

as possible. Recent research by LSU soil microbiologist Lisa Fultz suggested that farmers could build healthy soil by incorporating a diverse mixture of annual grasses, legumes and crucifer species overseeded into a long-term commercial grazing operation.

To test this strategy, Fultz, along with LSU graduate student Kathleen Bridges, obtained a SARE grant to fund a study on farms

in Baton Rouge, Louisiana. Fultz and Bridges compared the effects that the use of a winter annual mix of grasses (annual ryegrass,

triticale, oats), legumes (hairy vetch), clover (crimson clover), and crucifers (radish and turnips), and rotational grazing had on soil health at any given time. According to the study, overseeding a diverse cool-season cover crop mix into a rotationally grazed warm-season grass pasture improved soil health, especially when the system was managed over a longer period. When winter annuals were incorporated, soil organic matter improved, nitrate concentrations decreased, carbon concentrations stabilized, and soil microbial enzyme activity increased.

All of these are indicators of a healthy soil environment, making winter cover crops a viable opportunity for livestock producers to make their farms more economically and environmentally sustainable.

For more information on this project, see sare.org/projects and search for project number [GS16-158](#).

GRADUATE STUDENT GRANTS are for Masters and PhD students enrolled in a graduate program at an accredited institution who want to research sustainable agriculture.

GRANT SCHEDULE

February: Graduate Student Grants Call for Proposals is released.

May: Graduate Student Grant proposals are due.

August: Graduate Student Grants announced.

Proposals open in February and grants are awarded in August each calendar year. Graduate Student Grant project maximums are \$22,000 for two-year projects. SSARE recommends two-year projects; it is difficult to extrapolate usable, replicable, practicable data from one-year research paid by reimbursement of allowable project expenses.

MISSISSIPPI

Mississippi Project Highlight: Reducing Water Usage and Energy Costs Through Improved Irrigation Management

Will Hart's farm has been in his family for generations, producing corn and soybeans in the Mississippi Delta. However, water supply had declined in the nearby aquifer which negatively affected agricultural productivity and profitability. Over 90 percent of the irrigation water is withdrawn from the Mississippi River Valley Alluvial Aquifer, which created a water security concern for nearby producers. To combat this, Mississippi State University (MSU) assembled a team of researchers to create a program to educate producers on irrigation application efficiency and scheduling techniques.

With the help of a SARE Professional Development Program grant, MSU Extension professor Curt Lacy led a team of professionals to create an educational program to inform farmers on techniques that would maintain or improve yields with lower cost or less water use. This program equipped producers with the technical expertise and equipment necessary to assist those who want to adopt water-saving technologies. The knowledge provided by the program saved farmers money with streamlined pumping time and saved water and inputs, while farms produced comparable or better crop yields. This program helped Mississippi crop farmers, like Will Hart, use irrigation management tools to save water while staying profitable.

NORTH CAROLINA

North Carolina Project Highlight: North Carolina Researchers Find New Ways to Control Pest Mites in Tomatoes

For years, the two-spotted spider mite posed a serious threat to the health and productivity of tomato crops throughout the Southern U.S. Producers have attempted to manage these mites with chemical pesticides, however, chemical treatments were

not entirely effective and can pose other health risks. A naturally occurring predatory mite, *Phytoseiulus persimilis*, has shown to be effective at managing two-spotted spider mites. However, there is a concern with relying on *Phytoseiulus persimilis* mites since they are typically found in late August and September, which is weeks after spider mite populations are most intense.

Fig. 4. Spread of *P. persimilis* (shaded areas) from the release area on the left side (Week 0) across a 2.5 ha tomato field over a 6-wk period. Woodleaf, NC. 2019.

persimilis could be used to manage two-spotted spider mites. With the help of a Southern SARE grant, Walgenback investigated how early-season release strategies of *Phytoseiulus persimilis* can be used to control two-spotted spider mites in the tomato fields of North Carolina. Walgenback's research indicated that releasing *Phytoseiulus persimilis* early helped to maximize the

efficiency of the treatment and gave producers the opportunity to make their farms more economically and environmentally sustainable.

The SSARE Education Grant really gave us the resources to make these videos as inclusive as possible. The project travelled across 12 states and interviewed over 50 farmers, community gardeners, seed savers, seed growers and seed advocates. This would never have been possible without funding and we are extremely grateful.”

Chris Smith
SSARE Grantee
The Utopian Seed Project

EDUCATION GRANTS allow applicants to conduct education and outreach activities for the benefit of the greater sustainable ag community, and promote efforts in farmer innovations, community resilience, business success, ag diversification, and best management practices.

GRANT SCHEDULE

May: Education Grant Call for Proposals is released.

August: Education Grant proposals are due.

February: Education Grants announced.

Education Grant project maximums are \$50,000, limited to two (2) years.

Education Grants are paid by reimbursement of allowable project expenses.

OKLAHOMA

Oklahoma Project Highlight: Row Cover Use Methods for Cucurbit Pest and Pollinator Management

Researchers at Oklahoma State University (OSU) studied row cover strategies to determine how to produce the most productive plants possible. For years, Oklahoma farmers had used row covers on their vegetable crops to protect them from pests. While the row cover method has been effective at keeping squash bugs and other harmful pests out, research shows that the timing of row cover removal can impact the pollination process, which could have detrimental effects on subsequent crop yields.

Just before row covers are installed

To solve this problem, Jim Shrefler and a team of researchers at OSU studied the best row cover management practices for maximizing squash yields. Shrefler and his team received a SARE grant to conduct a two-year experiment to analyze pest and pollinator incidences and to measure squash yields using various row cover treatments at three farm locations in Oklahoma. The goal was to determine the best row cover management practices to provide ideal pest protection and help producers achieve the most productive plants possible.

For more information on this project, see sare.org/projects and search for project number [OS14-091](#).

Research and Education Grants

[LS24-392](#) Development of highly productive protected cultivation of tomato in Southern U.S., \$398,537, Langston University

Producer Grants

The Kerr Center
for Sustainable Agriculture

Since 1965, the Kerr Center has been an effective advocate for Oklahoma farmers and ranchers, for rural communities, and for a healthy, sustainable food system, from gate to plate.

“

Expansion of the Model State Program funding is having a positive impact on the work in all southern states.

It has resulted in more institutions working together to increase SARE's impact state and region wide.”

David Redhage
PDP Coordinator
President, Kerr Center for Sustainable Agriculture

PROFESSIONAL DEVELOPMENT PROGRAM GRANTS further education and outreach strategies for professionals and educators who work directly with farmers and ranchers.

GRANT SCHEDULE

July: Calls for pre-proposals are released

August: Pre-proposals are due.

October: Selected pre-proposals are invited to submit full proposals.

November: Full proposals are due.

February: Full proposals are funded.

There is no funding cap for projects. To fund a broad portfolio of projects, priority is given to those less than \$80,000. Projects can either be for one year or two years paid by reimbursement of allowable project expenses.

PUERTO RICO

Puerto Rico Project Highlight: Finding Common Ground with Farmers and Policymakers on Urban Agriculture Development in Puerto Rico

For years, socioeconomic, political, and institutional boundaries among urban communities have created an unsustainable food system in Puerto Rico.

The island does not have enough farmable land to support its 3.6 million people, which is why the country imports 85% of the food

it consumes. This has contributed to mass food insecurity, with 45% of Puerto Rico's population living below the poverty level. Maria Calixta Ortiz and a team of researchers at Ana G. Méndez University in San Juan tried to address this problem by developing a guide to urban agriculture that they hoped would guide the socioeconomic development of urban farming communities.

To create this guide, Ortiz and a group of researchers obtained

a Southern SARE grant to conduct a study, and they found that urban community gardens served an important social,

economic and environmental function in the community by satisfying the demand for local foods while utilizing empty urban spaces. According to Ortiz, local governments failed to recognize the benefits that urban agriculture initiatives can bring to the island, and potential farmers lacked the resources to pursue these initiatives on their own. That is why Ortiz and her colleagues created "Guideline

for the Development of Community-Based Urban Orchards in Puerto Rico" which strengthened urban agriculture on the island by providing recommendations for policymakers, municipalities, and other local officials to better work with small-scale urban farmers. This guide brought light to the potential social and economic benefits of urban agriculture and helped Puerto Rico begin to build a sustainable food system.

SOUTH CAROLINA

South Carolina Project Highlight: Summer Cover Crops for Organic No-Till Broccoli

Rachel Klein, the farm manager at Wild Hope Farm, studied various cover crop combinations to determine how to maximize the farm's production of organic, no-till broccoli. Wild Hope Farm has been using a wide range of cover crops for years to keep their broccoli plants as fruitful as possible. To help further increase productivity, Klein received a Southern SARE Producer grant to test out how different combinations of cover crops impact the success of their crops.

Summer Cover Crops for Roller-Crimped No-till Fall Planted Broccoli

In the study, "Summer Cover Crops for Organic No-Till Broccoli," Klein and the other workers at Wild Hope Farm implemented five

summer cover crop treatments in a no-till broccoli field. To determine which cover crop treatment is most beneficial, Klein and her team measured weed suppression, total yields and total labor hours for each treatment. The study found that sunn hemp is a viable cover crop option for producers to significantly increase their production of broccoli as well as the overall ecological and financial sustainability of the farm.

TENNESSEE

Tennessee Project Highlight: Soil SMARTS (Specific Management and Resources Training for Sustainability) for Soil Health in Tennessee

Researchers at Tennessee State University developed a curriculum and training manual to teach producers about sustainable practices they could implement to increase the health of their soil. In the past decade, awareness of the benefits of healthy soil has increased but a lack of technical and financial information on beneficial soil management practices has limited adoption in Tennessee. While some producers have engaged in soil health activities, there was a need to circulate this knowledge to more farmers about how to measure and improve soil health. To accomplish this, Jason de Koff at Tennessee State University worked with professionals from the University of Tennessee

Agents using soil health test kits during training

to obtain a Professional Development Program Grant from the Southern SARE program. With this grant, de Koff and his team developed the Soil SMARTS program, a soil health curriculum designed to provide farmers with the hands-on instruction they need to improve their soil. The program provided participants with an abundance of training resources, including materials from the USDA NRCS, modules on the economics of soil health and cover crops, a soil health test kit and access

to demonstration plots planted in each region of the state to compare management practices. With this knowledge, producers learned how to improve crop productivity and increase the economic and environmental sustainability of their farms.

RESEARCH & EDUCATION GRANTS encourage a systems approach to sustainable agriculture mainly designed for teams of interdisciplinary researchers.

GRANT SCHEDULE

March: Research and Education Grants Call for Pre-proposals are released.

June: Research and Education pre-proposals are due.

August: Selected pre-proposals invited to submit full proposals.

November: Full proposals are due.

February: Full proposals are awarded.

Grants require 2-steps: A pre-proposal and a full proposal for those invited by the review committee to submit. Research Grant project maximums are \$400,000, limited to three (3) years paid by reimbursement of allowable project expenses.

PRODUCER GRANTS enable farmers and ranchers to test a sustainable agriculture idea using a field trial, on-farm demonstration, marketing initiative, or other technique.

GRANT SCHEDULE

September: Calls for Producer Grant Proposals are released.

November: Producer Grant Proposals due.

March: Producer Grants awarded.

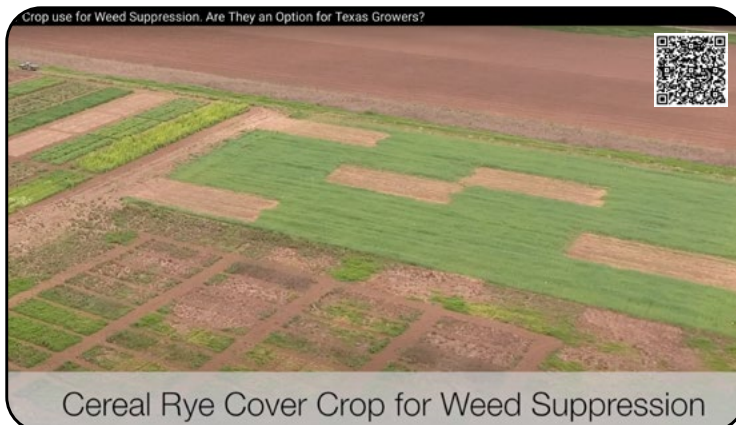

Proposals open in September and grants are awarded February the following year. Producer Grant project maximums are \$20,000 for an individual farmer or rancher, and \$25,000 for a farmer organization. Project duration is for 2 years. It is difficult to extrapolate useable, practicable data from one-year projects paid by reimbursement of allowable project expenses.

TEXAS

Texas Project Highlight: Texas A&M Researchers Identify Ideal Cover Crop Species for Southeast Texas

For years, farmers and ranchers across the Southeast have seen numerous benefits from incorporating cover crops on their farms; however, several factors have limited their adoption in Southern Texas. Many farmers in Texas rely on heavy cultivation and believe that the use of cover crops takes nutrients and moisture from their cash crops. However, research showed that cover crops can be a useful tool to increase production, build soil organic matter, recycle nutrients, and prevent erosion and suppress weeds. To test this, Spencer Samuelson, a field scientist for Corteva Agriscience and recent graduate from Texas A&M University, studied the effects of cover crops on soil health.

Texas A&M University Video

In a study funded by Southern SARE, Samuelson and Muthu Bagavathiannan, an associate professor at Texas A&M University,

tested 26 different cover crop species in multiple locations across Southeast Texas. They used a randomized block experimental design that allowed them to assess different combinations of cover crops, planting times and termination dates while also measuring the impact of cover crops on soil moisture levels and pest pressure. The results showed

that proper cover crop selection is imperative for achieving high crop yields in Southeast Texas. Samuelson's research allowed producers to see how using cover crops is an opportunity to increase yields while improving soil health.

VIRGIN ISLANDS OF THE U.S.

Virgin Islands Project Highlight: Lemon Grass (*Cymbopogon citratus*) of the Two Main Strands East Indian Lemon Grass (*Cymbopogon flexuosus*) or West Indian Lemon Grass (*Cymbopogon citratus*): Which one yields the greatest amount of essential oil?

The essential oil industry has been rapidly growing and has caused an increase in the market for lemongrass. While

India currently produces 80 percent of lemongrass oil, farmers in the U.S. Virgin Islands have seen this industry growth as an opportunity for producers to profit on lemongrass. To make profit cultivating a crop, it is important to choose the best of the breed. The one unknown factor in the selection of strands of lemongrass is which type produces the greatest quantity of essential oil. Until recently, there was no data that demonstrated the difference in

the quantity of production of lemongrass oil between breeds; however, farmers in St. Thomas and St. Croix teamed up to find what strand of lemongrass produced the highest yield of essential oil.

Participating producers obtained a SARE producer grant to develop an experiment where they could plot and compare West Indian and East Indian lemongrass. With the results from the experiment, the producers created a pamphlet to allow farmers to produce and

sell lemongrass most effectively. This research helped farmers discover how lemongrass is used in many different industries, which allowed farmers the opportunity to change their economic base by producing lemongrass.

It also helped to educate our local farmers and community members on measures to safeguard and enhance the health and wellness of farm along with measures to improve farm safety practices.”

USVI Commissioner of Ag
Former SARE State Coordinator

VIRGINIA

Virginia Project Highlight: Breeding and Evaluation of Butternut Squash Varieties for Southeast Organic Farms

Virginia farmer Edmund Frost was on a mission to develop the ideal butternut squash: a disease-resistant prolific producer of consistent shape and size with unparalleled taste. For a decade, Frost had received funding from Southern SARE grant programs to help him achieve this goal.

Over several years, Frost had tested a variety of butternut seed characteristics including taste, fruit shape, crop productivity and resistance to diseases. His research revolutionized butternut squash production by creating new and better breeds.

Small Block Trial Harvest

Frost's most recent project, "Breeding and Evaluation of Butternut Squash Varieties for Southeast Organic Farms," focused on

disease resistance to increase crop resilience and durability. To have healthy and sustainable seed production, all the elements of a seed system are important: production, variety trials, selection work that improves and maintains existing varieties, and breeding new varieties. Frost hoped his breeding research would help to accomplish this to create the most

vibrant seed system possible.
