COVER CROPS AT WORK
Increasing soil organic matter

THE TOOLKIT
Cover crops are tools to keep the soil in place, improve soil health, and reduce nutrient pollution from farm fields. The cover crop toolkit includes grasses, brassicas, legumes, and other broadleaf species.

SOIL ORGANIC MATTER
Soil organic matter is decomposed organic material (leaves, roots, microorganisms) that exists in the soil and acts as a reservoir of water and nutrients.

Across several studies, legume cover crops were found to increase levels of soil organic matter by 8 to 114%, and non-legume cover crops were found to increase soil organic matter levels by 4 to 62%.

WATER QUALITY BENEFITS
- Soil organic matter enhances soil processes and properties, and alleviates soil compaction.
- Organic matter also increases water retention capacity and can absorb and filter pollutants in runoff and groundwater.

By increasing soil organic matter, cover crops contribute to enhanced water quality and improved soil water and nutrient conditions.
